3D DWG file The underlying storage format of the 3D DWG file is a collection of lists and arrays, organized into three groups: objects, primitives, and attributes. Objects are the basic units of a 3D model. Primitives consist of surfaces that may have other primitives or surfaces as children. Attributes are names and values associated with objects and primitives. These are the building blocks of the 3D DWG file. In addition to the objects, primitives and attributes, the 3D DWG file is divided into a number of header blocks and a data section. Objects have a reference count value associated with them and primitives can be linked to a number of other primitives. There are many other data structures including bounding volumes and any other block hierarchy that is used in the 3D data. The basic rules for interpreting the data of a 3D DWG file are as follows: Each 3D DWG file starts with the HDR block. The top level of the file has an object named "HDR" and the object has a reference count of one. All primitives and blocks must be contained within the HDR object. All attributes must be contained within the HDR object, or within the child objects of the HDR object. Attributes include: origin, rotation, scale, and color. All blocks inside the data section of the 3D DWG file must be inside a block list. DXF files are saved in a directory hierarchy. A DXF document is composed of a collection of objects and primitives, where each object can be one of a number of different geometric types. Objects consist of primitives which are lists of points and/or polygons. Many of the objects in DXF files are used in conjunction with AutoCAD drawings, and contain the exact information that AutoCAD uses to draw on paper. The name of an object can be used to identify the type of geometric object it is, and AutoCAD can automatically determine if the object is a text object, a path, a line, a line segment, a polyline, or another type. An example of a valid DXF file is: This is a valid DXF file for an AutoCAD drawing. The primary structural content is in the header block. The header block contains four items: FILL, EXTERNAL, DATABASE, and LINK. The FILL item consists of 4 fields: a name of the color, type of the a1d647c40b
