SQL Server Central Community Panel (SQLCP) is a Community Software Development Kit that provides an easy to use UI based on open source toolkits to build simple and powerful desktop widgets that integrate SQL Server Management Studio. The Add-Ins are single file sql projecs which contain the files used in the installation. They are referenced by a VS.csproj file. The files are well-named and all the metadata is stored in solution and build files. To summarize, they look like the following. File Name Description sqlproj The.sqlproj contains the files which are packed and installed as a VS solution. Add-Ins Each file is referenced by a.csv file in the same solution. The.csv contains the version number, the registered name of the file, the directory in which the file is contained, the kind of file it is. The.csv also contains the assembly_name and the database_name where the addin is registered. AssemblyInfo.cs This is where the magic happens: the files of the assembly are stored. For each addin there is an AssemblyInfo.cs file containing information about the file as well as the name of the file where the assembly is registered. The assembly_name is used to name the project in Solution Explorer. Add-InNames.cs The.csv file looks like this. The first line is the name of the file. The second is the name of the addin. For example: cs69_10-4-2013.csv Add-In_sqlCommandCreator.cs A class implementing the ISqlCommandCreator interface. This interface provides the name of the sql command to be executed. AssemblyInfo.cs The.csproj describes the assembly. For example: 1.0.0.0 1.0.0.0 true

ClearTrace is a freeware that has been designed for users who use SQL Server 2005, 2008, 2008 R2, 2012, 2014, and 2016. It allows you to import trace and profiler files (those that are.trc and.xom) from these servers. No need to install any SQL Server components on your computer; this app will only extract the data and import it to your computer. The import process is performed using only the.NET Framework, so your computer should be up to date. Importing the contents from a trace file takes up to 40 minutes, but you can configure the task to run every 10 minutes if you want. You can also load up to 500 traces. The app will do the importing in real time. You can export the results that you've created (QTP, Trace and Profiler files) to file and open them in any text editor.Q: Extra line in 3d circular spline I have a problem that I am unable to solve. I am pretty sure that the issue is mostly related to hardware but I can post it on the software side as well if needed. I have a 3D circular spline (let's call it A) and I would like to make a 2D spline B that intersects it in some points (let's say p1 and p2). If I simply add the points p1 and p2, I get the following result: Here it's clearly seen how the intersection at the bottom is almost vertical. But if I move the points a bit, I get something different: This is definitely the correct solution. But it has an extra vertical line and I have no idea why. I first thought this was an issue related to the math library (i.e. that it was rounding the results badly) but I tested the same thing using a 2D spline and the problem still exists. I'm aware that I can minimize the impact by finding the right control points, but I think that it's better to understand what is happening here. A: The shape you're generating is incorrect. The curve should be two-dimensional as well. Your shape becomes a n-dimensional space when you define two more points. It's simpler to keep it as a two-dimensional space and tweak it when you intersect it. Keep it as a 2D space when you find its control points, but
