Is it the first smartphone with a modular design that could change the way we think about smartphones? Is it the first smartphone with the new LG G5 and, more importantly, is it worth buying? I don’t think so. What is the LG G5? Well, it is the LG G5, the latest smartphone from LG – the Korean company that has been on top of the smartphone game for a number of years now. And as we know, LG doesn’t like to stray far from its winning ways, and that is certainly true with the LG G5. For starters, the phone is a solid rework of the LG G4, with a sleek design, high-quality hardware and is very competitive on price. However, there are few glaringly obvious improvements in the LG G5, aside from the physical design, which is relatively unchanged from the G4. LG G5 Review – Hardware The LG G5 is the first smartphone in the market to feature a modular design. That is to say that it is the first smartphone on the market to be built around two modules that can be attached to the phone. What does that mean? Well, it means that you can easily upgrade your phone as you see fit. More specifically, the two modules that are included with the LG G5 are: The battery The second module will not be for everybody, however, and you can only use it if you have an LG G5 battery that is ‘+1’, as it is designed to be an extension of the LG G5. The ‘+1’ means that it increases the capacity of the phone, and you are able to get an extra 20 percent of battery life. The battery module that comes with the LG G5 is the LBP-920 and it can be replaced by a compatible battery, albeit a rather expensive one. However, the module that comes with the LG G5 is around €80, which is over ten times more expensive than an equivalent ‘replacement’ battery. The battery

Synthesis of the DNA-binding ligand pyrrolo[2,1-c][1,4]benzodiazepin-5(H)-one and related chromones. An efficient synthetic route to the DNA-binding ligand 2,7-diamino-5,6-dihydro-4H-pyrrolo[2,1-c][1,4]benzodiazepin-4-one and its chromone derivatives has been developed. These compounds possess potent inhibitory activity against topoisomerase II (TOP2), and therefore we describe a route to the key intermediate 7-amino-3,4-dihydro-2H-pyrrolo[2,1-c][1,4]benzodiazepin-5(6H)-one. Q: Dynamically define function parameters from a list in python I am trying to define a function that would be called with variable number of parameters. But I want the arguments to be of different types, and those types would be defined in a list. So I could call it like this: some_function(arg1, [arg2, arg3, arg4]) and in the function definition I could do something like this: def some_function(*args, **kwargs): for a, b in zip(args, kwargs.values()): pass I need this function to be generic enough, so that it could be used with different types of parameters, like some_function(int, list, dict) some_function(int, bool, list) etc. Is there a convenient way to do this? I am not looking for solutions like using *args and **kwargs as they are just syntactic sugar for this, but solutions that require me to change the definition of the function with each change in the number of arguments it takes. A: As stated by the great rwofff in the comment, how about following? import inspect def func(func_name, *args): argspec = inspect.getargspec(
